# Platform Infrastructure Architecture

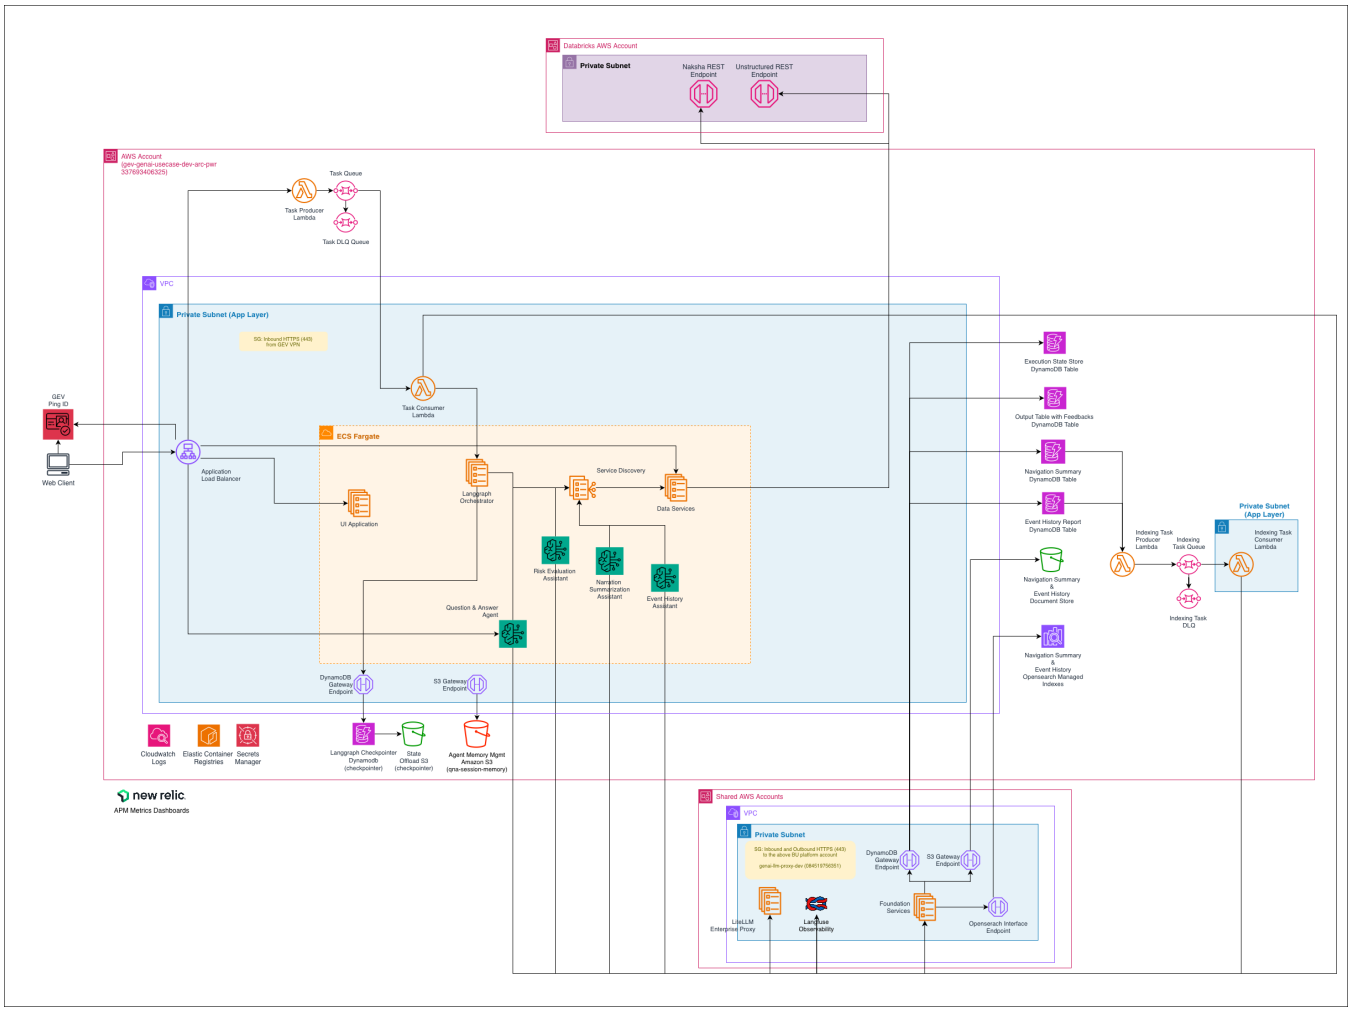

## Design Highlights

### Application Load Balancer includes following routes

1. Submit Risk Evaluation Route - This returns the SQS message ID as the execution ID
2. UI Application Route - Primarily server UI application, in addition to it supports following sub routes
    a. Fetch execution ID status via foundation service
    b. Fetch data services for fetching DBR data
3. Returns responses from Question and Answer Agent

### Task Bridge

It invokes downstream services with a Circuit Breaker implemented via PyBreaker. We will start with a in-memory circuit state store, later based on system performance we can implement an external Redis based circuit state store
